

Asphalt duvets

The low-cost way to protect hot asphalt in transit

A Proteus asphalt duvet is the ideal way to keep your asphalt hot with minimal investment, and they will contribute to quality and productivity on many construction jobs.

The duvet will tolerate temperatures of up to 240°, so they can be laid directly on top of the load, and the metalised polymer-coated outer foil ensures the duvet does not get coated in sticky bitumen.

Light and easy to handle, Proteus duvets are perfect for protecting your hot material from the harmful effects of snow, wind and rain as it travels to the job.

Proteus carries stock sizes designed to fit standard vehicle types, but bespoke duvets can also be made to absolutely any size to suit all requirements. Options include extra wadding for additional insulation, or eyelets to allow easy fastening to vehicle bodies.

An asphalt duvet can also be used to further improve the lifespan of material stored in a Hot Box.
